Aluminium claddings provide an unlimited possibility in the creation of a colourful and modern architecture. It also means greater stability, durability and resistance of the profiles. Dedicated to the Decco 83 system.

- Aluminium claddings are an additional protection for PVC profiles against the weather
- They assume most of the thermal load caused by sunlight - which reduces the risk of structural deformations
- Lacquer on the aluminium profiles has an above-average resistance to discolouration caused by ageing and weather factors (light, temperature, rainwater)
- They are also an additional protection against noise
- A unique appearance thanks to the possibility of connecting the claddings at an angle of 90° without cutting them diagonally (butt-jointing)
- The possibility of butt-jointing at an angle of 90° means reduced workload and time during production, as well as reduced number of errors and material loss
- They increase the static properties of windows
- Lacquering with any RAL colour
